Dear All,

in order to reduce traffic accidents, I would like to suggest to force the manufacturers of mobile phones (Samsung, Apple, etc...) to disable the **keyboard** of the mobile phone , when the **accelerometers** (all smart phone are provided) sensors embedded into mobile phone detects a speed rate 'greater than 15/20 km / h.

Obviously this function must be implemented embedded into mobile phone operating system at firmware level , so that it cannot be disabled by 'user.

Above solution will avoid to use the keyboard of mobile phone for messaging , Facebook, WhatsApp , etc , while people are driving .

In my opinion to use the keyboard of mobile phone during drive a car , truck , etcc is one major causes of accidents on the road

Voice function of mobile phone can remain active (to call and to receive call) only if the phone operating system detect that an earphone is physically connected to it or handsfree phone call is activated , or the Bluetooth phone function is activated and connected to the car audio system

Above simple improvements related to use phone mobile keyboard and voice function , for sure will reduce significantly the amount of traffic accidents.

I live in Rome, I'm a moto biker and I see every day a lot of people that drives and in mean time use the mobile phone for messaging and for voice call , you cannot image how many accidents I see every day due to use of mobile phone on the road.

I've already sent this kind of email to Mr. Samsung, Mr. Apple , Mr. Toyota , some Italian magazines , but nobody answered to my email .

Evidently, economic interests are more important than people's lives

I hope that your civilized country can applied , or to force the main mobile phone manufactures to implement my suggestion in order to save a lot of people .

Best regards

Renato Diglio
